Free

Indication

Zebinix is indicated for the treatment of focal-seizures in patients above the age of 6 years

● *Monotherapy in newly diagnosed*

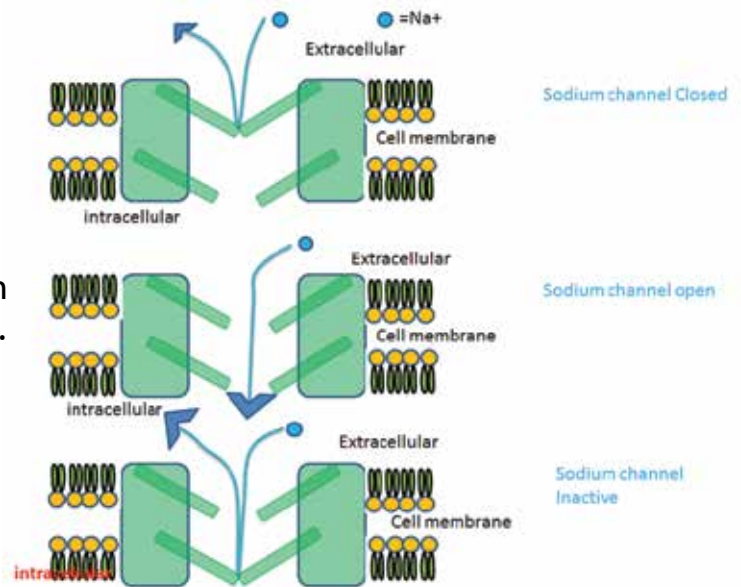

● *Adjuvant therapy in refractory seizures*

About Zebinix

Zebinix is a 3rd generation anti-convulsant medicine called Eslicarbazepine. Eslicarbazepine works by blocking the sodium channel and inhibits the neuronal transmission.

Dosage

Zebinix may be taken as monotherapy or added to existing anticonvulsant therapy. The recommended starting dose is 400 mg once daily which should be increased to 800 mg once daily after one or two weeks. Based on individual response, the dose may be increased to 1,200 mg once daily.
